- Report skeleton (what to write)
- Checklist (what the validator checks)

ch-3 Personal Project — Guide

Build a small **personal project** and show you can drive Claude Code with a real **MCP + skill + agent**, then ship a report and slides.

Companion docs: [ch3-ideas-toolkit.md](#) (ideas + snippets) · [apis.md](#) (free APIs) · [GITHUB_SEARCH.md](#) (find examples).

Steps

- 1. Make your repo** — public, on your GitHub. Commit as you build (small, frequent commits — this is your git workflow / methodology).
- 2. Use all three** in the repo: - **MCP** — add `.mcp.json` (or `mcpServers` in `.claude/settings.json`). - **Skill** — at least one `.claude/skills/<name>/SKILL.md`. - **Agent** — at least one `.claude/agents/<name>.md`.
- 3. Slides** — copy `ch-3/pechakucha-6x20.md` (in your team repo), keep it **6 slides, 20s each** (Marp only, `auto-advance: 20`). Put the Marp source in your repo.
- 4. Report** — copy `ch-3/_TEMPLATE.md` (in your team repo) to `ch-3/<your-github-username>/report.md` in your **team repo**. Fill every field. In Evidence, list the real paths (`.mcp.json`, `.claude/skills/...`, `.claude/agents/...`) — the checker confirms they exist.
- 5. Submit** — push / PR the `ch-3/<you>/report.md` to your team repo.

Suggested timeline (≈ one focused day)

Step	Time	Output
Pick idea + make repo	30 min	public repo, README
Add <code>.mcp.json</code> + verify tools load	30 min	working MCP
Build smallest working version	2–3 hr	one feature works end-to-end
Add skill + agent, use them	1 hr	real skill + agent in your flow

Step	Time	Output
Write <code>report.md</code>	45 min	all fields filled
Make 6×20 Marp slides	45 min	slides committed

Don't leave report + slides to the end. Write them as you build.

What "good" looks like

- The **skill and agent are actually used** — your `report.md` points to the exact moment they helped, not just empty files.
- **One feature works end-to-end** (a vertical slice) rather than many half-features.
- **Many small commits** tell the story of how you built it.
- **No secrets in the repo** — keys live in `.env` (+ `.gitignore`).

Report skeleton (what to write)

- **What it does** — one paragraph.
- **How I built it** — your methodology, key decisions, what Claude Code did vs you.
- **MCP / Skill / Agent** — which ones, and **where** each was used.
- **Evidence** — real file paths: `.mcp.json`, `.claude/skills/<name>/SKILL.md`, `.claude/agents/<name>.md`.
- **What I'd do next** — one or two honest next steps.

Checklist (what the validator checks)

- ☐ repo owner == your github username
- ☐ `.mcp.json` + a skill + an agent present **and used**
- ☐ methodology written in `report.md`
- ☐ slides = Marp, 6 slides, 20s auto-advance
- ☐ all report fields filled + evidence paths exist
- ☐

`report.md` at `ch-3/<your-github-username>/report.md` in the team repo
